

The Unnoticed B-Weapon

We should have noticed before. We noticed, perhaps, that somehow something irregular was happening but other events strained my paranoid and your healthy brain. Still, it is difficult to oversee that something is going on beyond the decent historical development of co-incidents.

We noticed how the birds fell victim to the bird's (or avian) flu. How regrettable for the birds but what did it matter to us? Apparently quite a lot, since excessive precautions were taken, which could hardly influence the spread among wild-living birds. A disproportionate effort is made of diagnosing dead birds in European and other Mediterranean countries. The lack of sustained human-to-human transmission suggests that this AH5N1 avian virus does not currently have the capacity to cause a human pandemic [1]. After all, in spite of extensive efforts and negative announcements, less than 10 people have currently (beginning of April 2006) succumbed in this area and less than 100 dead birds have tested positive to the disease in Europe. The birds are still singing, not coughing or screaming in panic. What is the reason for this panic?

We were very early made aware that the avian flu carried resemblance to the so-called 'Spanish Flu,' which tormented the World 1918-19. It claimed the life of double as many humans (~ 50 millions) as the preceding First World-War of 1914-18, and analysis has shown that it started as an avian flu, which then jumped to humans [2]. So if that is underway, there is indeed reason for panic. And the interest went beyond the academic of possibilities: in October 2003, it was proudly announced [3] that so-called scientists had resurrected the 1918 flu. The team used pieces of virus taken from preserved samples from 1918 victims, as well as from the corpse of a victim dug up from a frozen grave in Alaska in 1998. They used these pieces to make a replica of the 1918 virus, analysed the genetic code and brought it back to "life," as reported two years later [4]. This marked the end of a 9-year effort to rebuild the agent that swept the globe in record time. And then it deserves attention that these heroes were working for the American army. These American researchers obtained the viral particles from the H5N1 Spanish flu virus that killed millions worldwide and altered one of its ten genes, making it far more dangerous and virulent than any influenza virus in nature [5] – and notably, hardly anybody alive today are resistant to this infectious disease which had its high season 87 years ago. Almost simultaneous to the publication of these 'pioneer results' it was revealed, that by infecting mice with the current bird's flu, the researchers found several features that increased the virus' virulence [6].

What was the purpose of this Dr. Frankenstein's science? Officially, it was created in order to develop a vaccine and thus prevent a repetition of the Spanish Flu. However, there is little need for antiviral drugs against the 1918 strain if the 1918 strain had not been recreated in the first place; as the biologist Jan van Aken put it: "It simply does not make any scientific sense to create a new threat just to develop new countermeasures against it" [7]. Unless, of course, to the psychopathic brains of those in charge the vaccine-development believes it is hereby possible to prevent outbreak of the disease to a superior population offered the protection while all others succumb. That such a thought may be involved could be the reason behind 'Biodefense and Pandemic Vaccine and Drug Development Act,' which would *force* Americans to receive inoculations against a disease that has yet to kill one of them [8]. It would also ban citizens from using the Freedom of Information Act to discover whether the new vaccine (when it is finally produced) was effective and safe. That there are psychopathic and humanity-despising

brains at work on high post in Washington has been convincingly demonstrated on other occasions. But then, there is also Tamiflu ...

The Case for Tamiflu

Tamiflu is a drug, distributed by Roche, and it ameliorates the course of common flu, so it is hoped that it also acts against the bird flu. Untreated, Bird's flu in humans produces fatalities in the range of 50%. Treated with Tamiflu ... nobody strictly knows. It did not help two bird flu patients in Vietnam who had been treated with Tamiflu [9], but two cases do not permit evaluating any considerations about incidences (in particular, if the treatment started late (which I merely suggest as a possibility). Whether the drug is as useless towards the new threat as suggested in some blogs [10,11], remains to be proved but both the British Medical Journal [1] and the New England Journal of Medicine [12] have published relevant warnings that this may be the case. If it indeed is, it will become an unprecedented case of 'emperor's new clothes' in pharmacology. It has been purchased to pass a staggering 2 billion \$ while many countries have stockpiled immense amounts of it for use in the coming pandemic, which currently did not kill a single patient in most of these precautious countries – and we do not know, if Tamiflu will then help.

What excellent development of Roche – no wait, they are only producing it on licence from an American firm, Gilead, Inc., in which the majority stockholder is none other than Donald Rumsfeld [13], the Master of Pentagon. Is he then the one to save a (selected) part of humanity or simply getting rich from a worthless drug? We do not know. What is certain is, that this is another track leading from the avian flu towards the Pentagon. Besides, the warning, "Before you start getting shots of Don Rumsfeld's new drug ... better take a closer look at some of his old ones" [14] deserves attention. These are the dark sides of pharmacology, as his current career reveals other dark sides.

Spreading the Success

Unlike other products, which are laboriously spread through complex and expensive marketing, this product spreads itself the cheapest way. Then, the embattered people may come down to their knees (if they haven't been brought further down) and beg for the cure. We do not know if the current avian flu is a natural occurrence or the result of the American 'research.' It suffices to be a natural occurrence, and then there is still the question of activating the malignant version, to which various initiatives can be recognized:

The first was the sudden openness to share the recognitions with other laboratories than the military one, which had created the prototype. Exactly how big an arsenal is kept remains obscure [15], but it sufficed to raise concern as it was revealed that 5,000 laboratories Worldwide were given samples delivered by common mail [16,17]. As Rivero remarked, "So, we're one clumsy deliveryman away from a major epidemic." Then, the genetic code was made public, as if the alleged enemy in Afghan caves could utilize this information. The New York Times responded with this statement "The 1918 influenza virus is even more dangerous than an atomic bomb. Revealing its recipe on the Internet is extremely foolish and unnecessary" [18]. Possibly, it is more evil than foolish.

Still, the development was not proceeding fast enough. In April 2006, the Washington Times reported that "The US Centers for Disease Control and Prevention has begun a series of experiments to see how likely the bird flu virus could result in a human pandemic" [19] – with a little help from my friend, the needed mutation shall be achieved.

After using napalm and white phosphor in addition to spreading nuclear waste in Iraq and preparing for a nuclear attack on Iran, and after inserting chemical weapons in the destruction of Falludja, it seems that the American government is also preparing for the use of biological warfare, to complete the triad of forbidden arms: A, B and C. Not that we can do anything about it, I just wanted you to know.
